

World CLL Day 2021

YOUR IMMUNITY PROTECTS OUR COMMUNITY

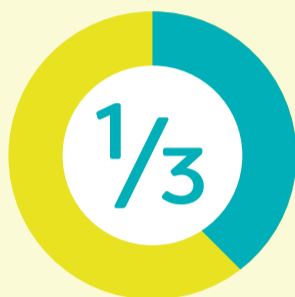

CLL, or Chronic Lymphocytic Leukemia, is a type of cancer that affects the white blood cells.

The facts

CLL is the

accounting for

of all leukemia cases

yet, despite this, it's classed as a

RARE CANCER

Who is affected

50+

CLL MOST COMMONLY AFFECTS MEN OVER 50. Men are diagnosed twice as often as women.

Yet, CLL CAN affect any adult, regardless of age or gender ...

with increasing numbers of younger & female patients.

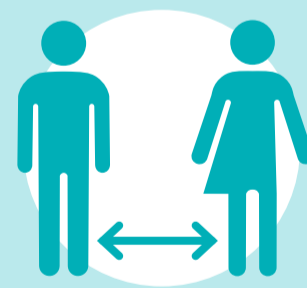

CLL is a chronic condition and not usually curable

Why immunity is important

CLL patients are **IMMUNE-COMPROMISED**

They do not get the same benefit from vaccination as the healthy population.

Vaccination of the whole population and other protections are the best chance for protecting all those living with CLL.

Today, on World CLL Day, we reflect on the themes of protecting ourselves & protecting others.

THANK YOU FOR PROTECTING OUR COMMUNITY!
